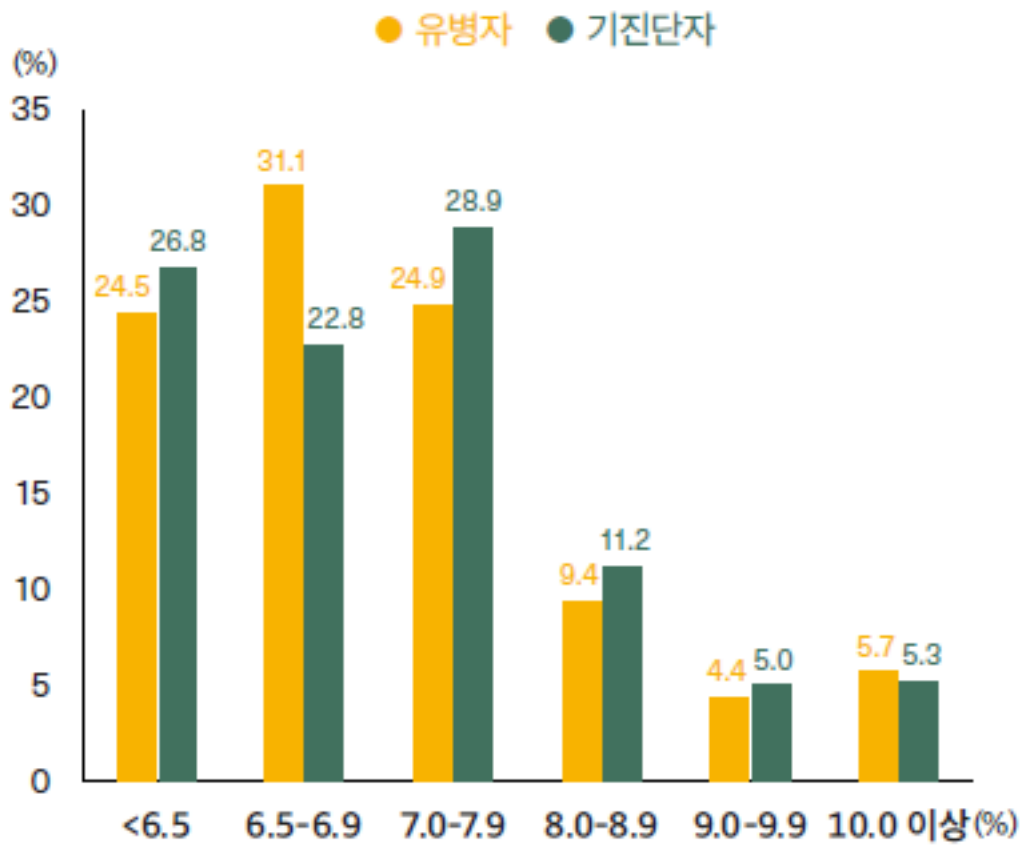
혈당 조절 상태

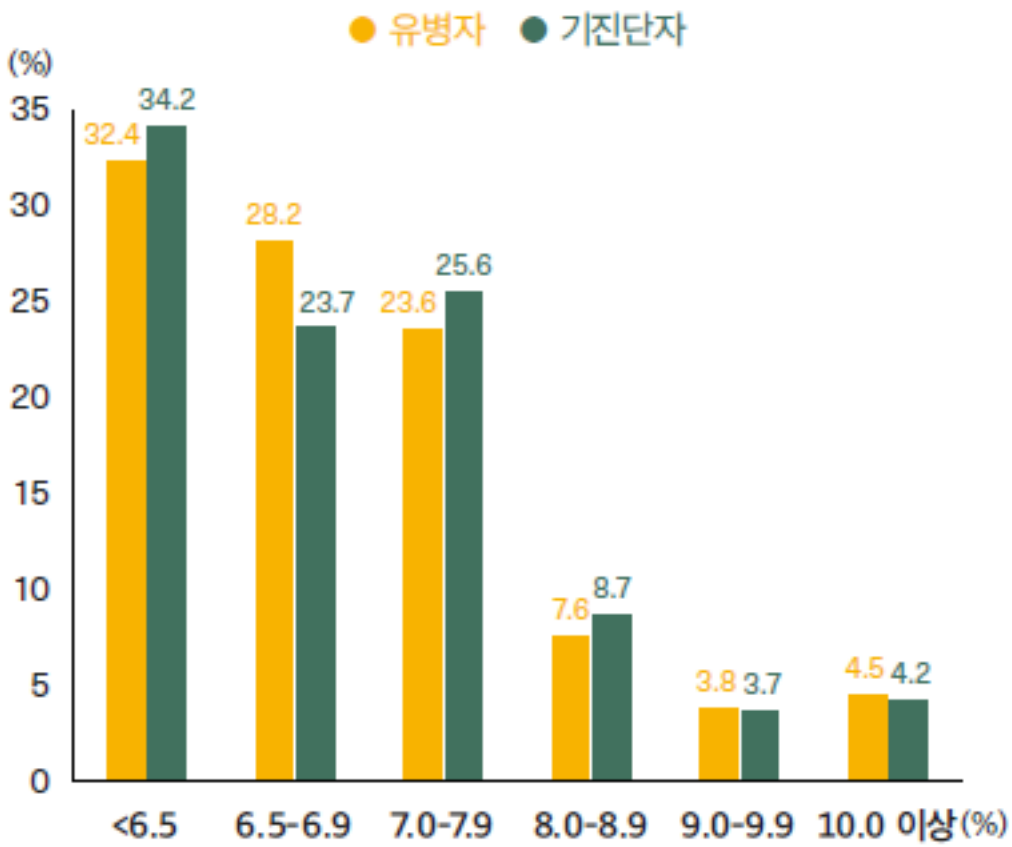
당뇨병 유병자 중 당화혈색소가 6.5% 미만인 경우는 3명 중 1명 (32.4%) 밖에 되지 않았고,
당화혈색소가 7.0% 미만으로 조절되는 경우는 60.6%임.
당화혈색소가 8.0% 이상으로 적극적인 치료가 필요한 경우는 16%임.
2019-2020년 보다 2021-2022년 통합자료에서 기진단자의 혈당조절 상태가 매우 좋아짐.

<6.5%, 기진단자
34.2%

2019-2020년 통합

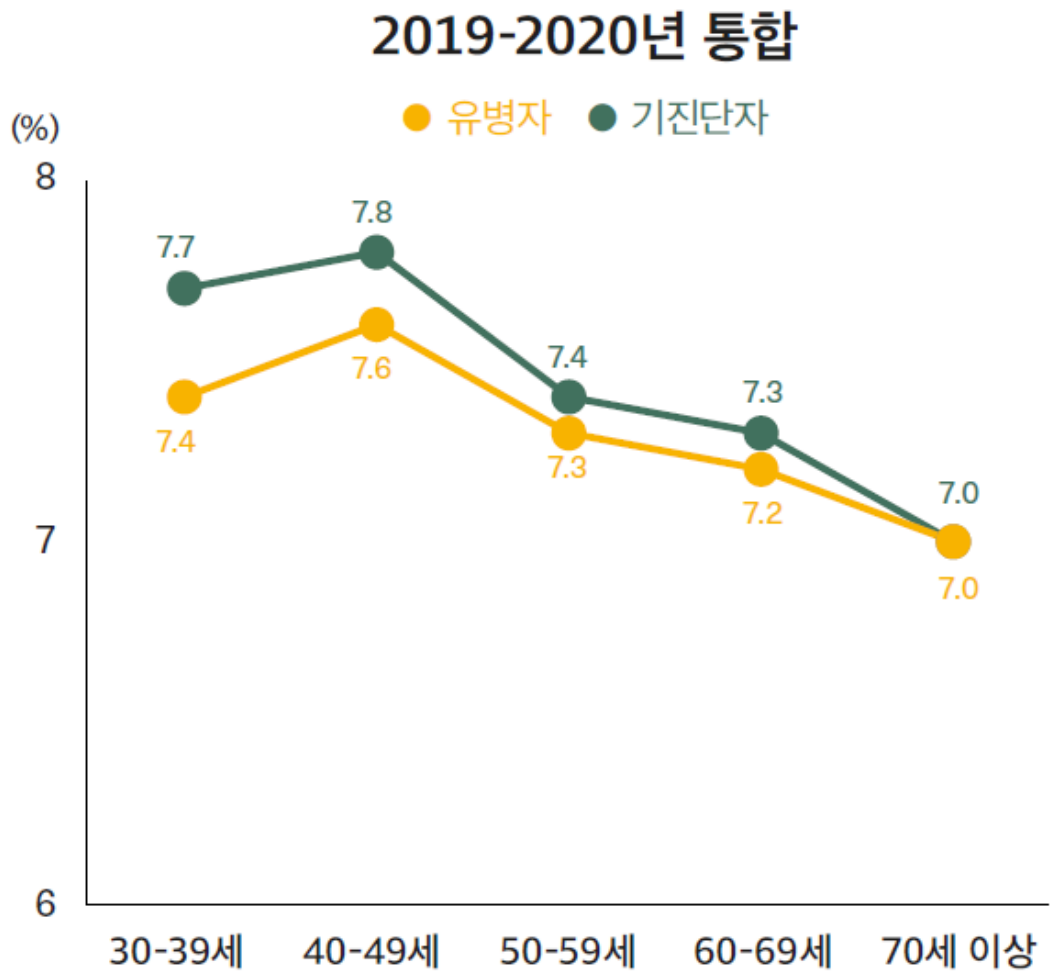


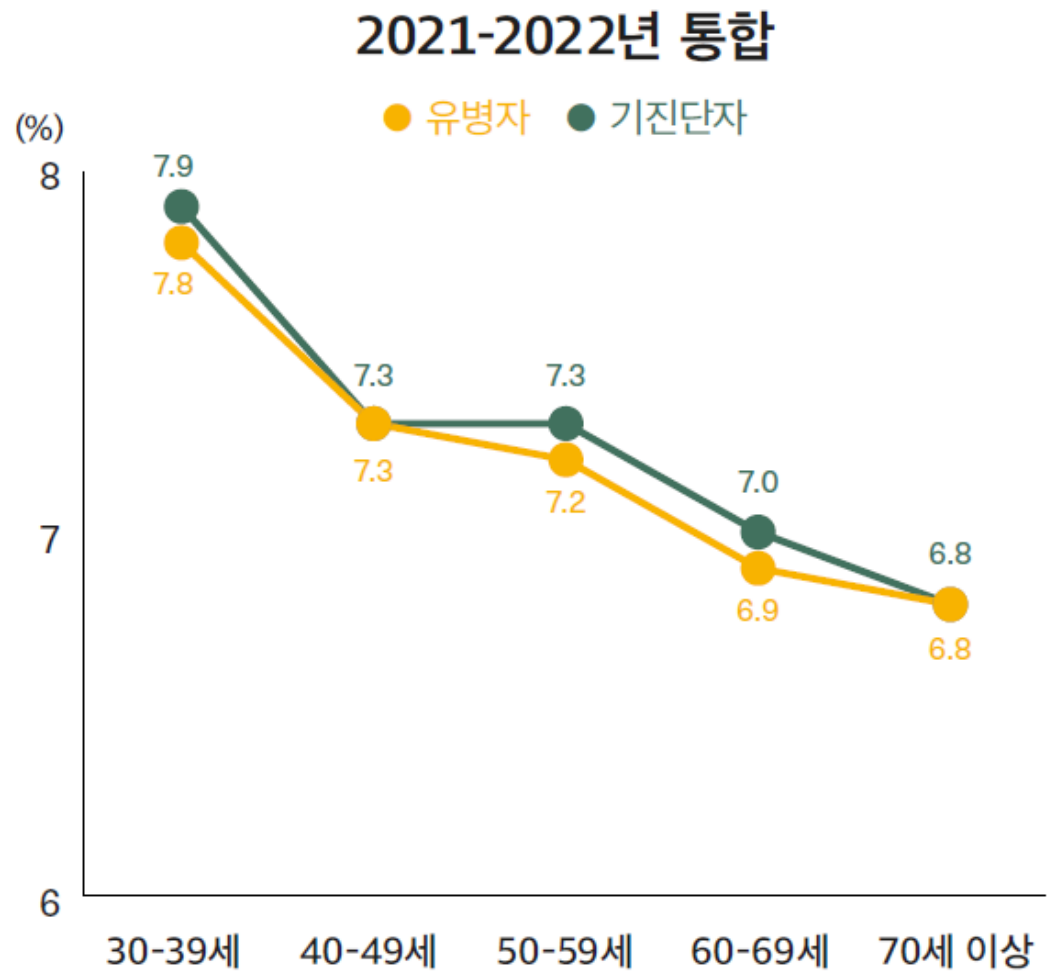
2021-2022년 통합



연령대별 평균 당화혈색소

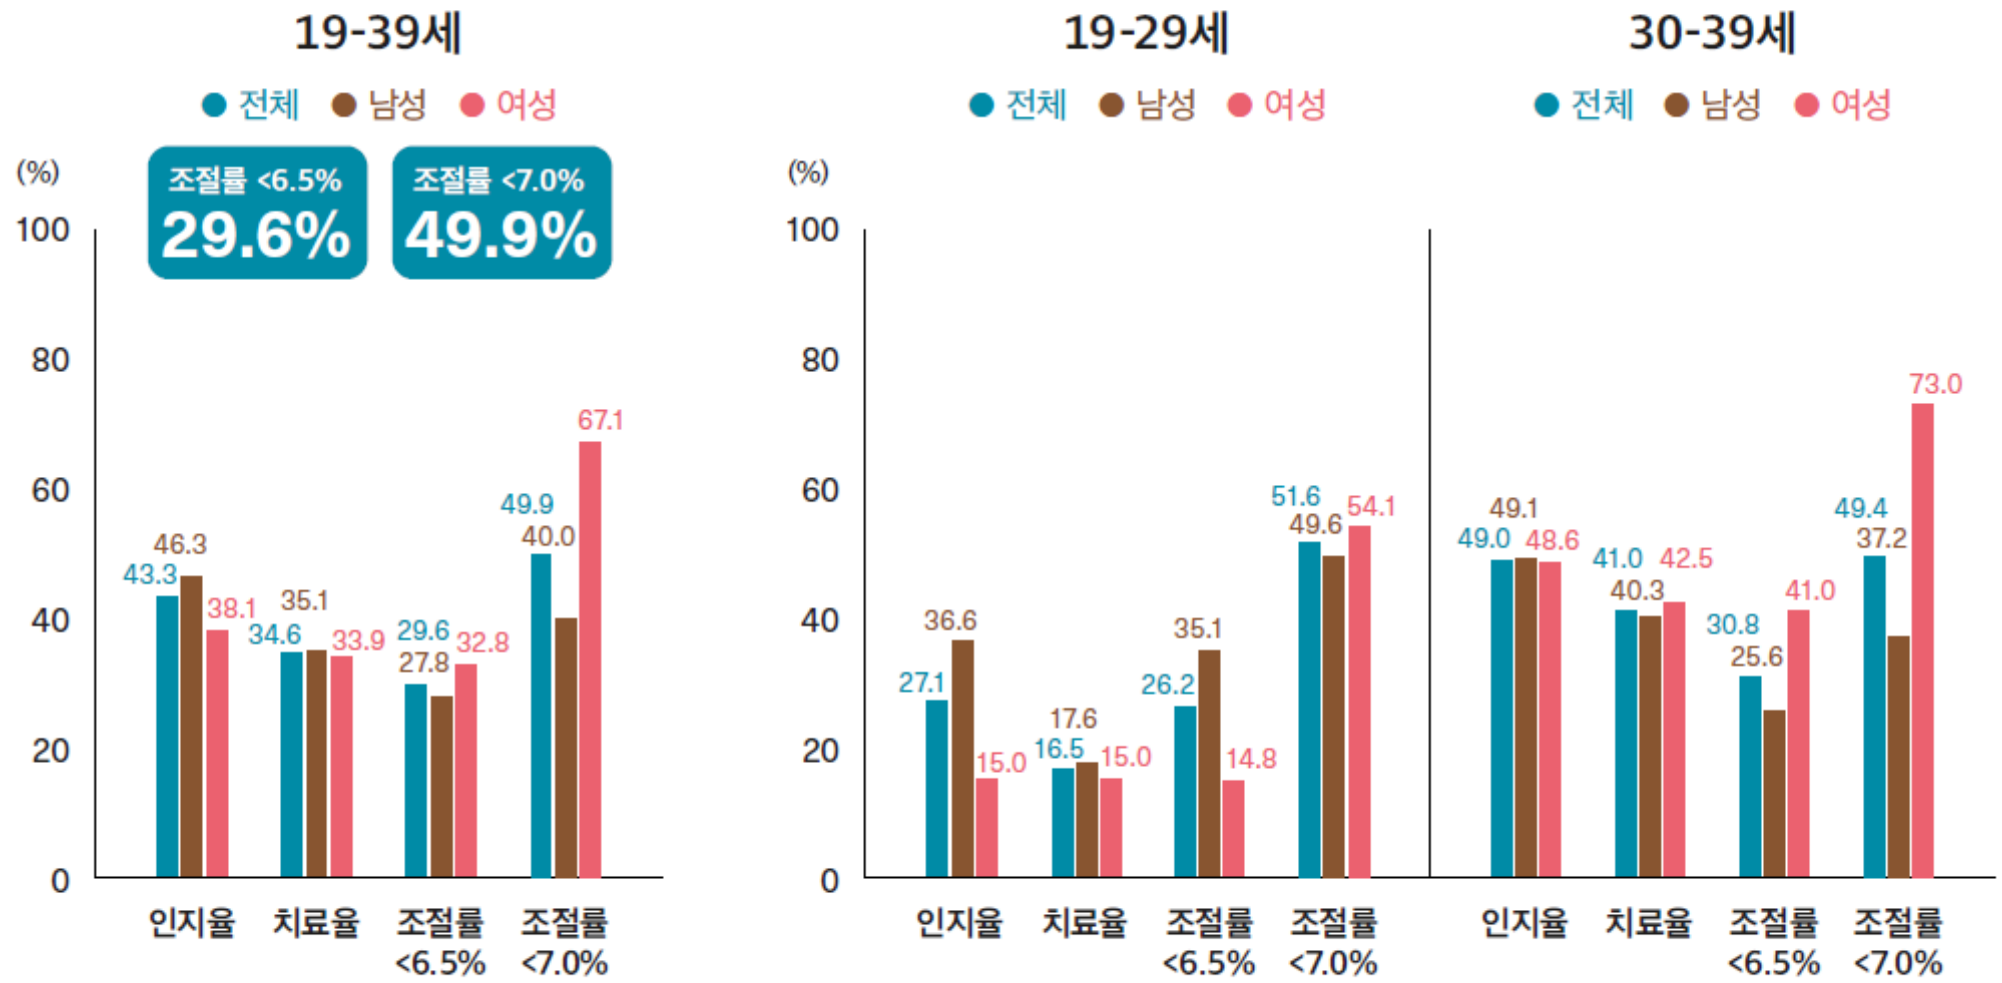
연령대별 평균 당화혈색소는 30-40대에서 다른 연령대에 비해 더 높음.
40대 이후 평균 당화혈색소가 2021-2022년도 향상되었으나 30대에서는 이전에 비해 더 높은 수치를 보임.





청년 당뇨병 관리 수준 (2019-2022년 통합)

청년당뇨병환자의 43%만이 당뇨병을 진단받았고, 35% 정도만 당뇨병약제로 치료 중임.
당화혈색소 6.5% 기준으로 10명 중 3명만이 혈당조절 목표에 도달함.
청년층 중에서도 20대에서 인지율과 치료율이 매우 낮고, 특히 조절률에서는 남녀간 심한 차이를 보임.



당뇨병 유병자: 공복혈당이 126 mg/dL 이상이거나 의사로부터 당뇨병을 진단받았거나 당뇨병약제로 치료 중이거나 당화혈색소가 6.5% 이상인 경우
당뇨병 인지율: 당뇨병 유병자 (당화혈색소 기준) 중 의사로부터 당뇨병 진단을 받은 분율 / 당뇨병 치료율: 당뇨병 유병자 (당화혈색소 기준) 중 현재 당뇨병약제로 치료 중인 분율
당뇨병 조절률: 당뇨병 유병자 (당화혈색소 기준) 중 당화혈색소가 6.5% 미만인 분율, 당화혈색소가 7.0% 미만인 분율

CKD Screening and Diagnosis

Who and when to screen?

T1D Yearly starting 5 years after diagnosis

T2D Yearly starting at diagnosis

Both the ADA and KDIGO recommend annual screening of patients with diabetes for CKD

How to screen?

Spot urine ACR

and

eGFR

What to do with a positive result?

Repeat and confirm:

- Evaluate possible temporary or spurious causes
- Consider using cystatin C and creatinine to more precisely estimate GFR
- Only persistent abnormalities define CKD

Initiate evidence-based treatments

What defines CKD diagnosis?

Persistent urine ACR ≥30 mg/g

and/or

Persistent eGFR <60 mL/min/1.73 m^2

and/or

Other evidence of kidney damage

Persistence for at least 3 months is therefore required for diagnosis

9. Pharmacologic Approaches to Glycemic Treatment- T2D

NEW **9.19** 심부전 (*p*EF/*r*EF)에는 SGLT2i을 권고 **A**

- 혈당 조절과 심부전 입원 예방

NEW **9.20** CKD*: SGLT2i 반드시 사용 **A**

- CKD 진행 최소화
- CV event/ 심부전 입원 감소

**(eGFR 20 – 60 and/or albuminuria)*

NEW **9.21** T2D+CKD (eGFR<30) 에서 GLP-1 RA는 혈당조절 목적으로 선호됨 **B**

- 저혈당 위험 감소/ CV event 감소

Potential mechanisms underlying the kidney benefits of SGLT2 inhibitors

- Activation of tubuloglomerular feedback (leading to reduction of intraglomerular pressure and glomerular hyperfiltration)
- Reduced proximal tubule metabolic stress and hypoxia
- Reduced mitochondrial damage
- Reduced hyperglycemia-induced inflammation
- Reduced oxidative phosphorylation and less production of reactive oxygen species and angiotensinogen
- Improved oxygenation/reduction in plasma volume

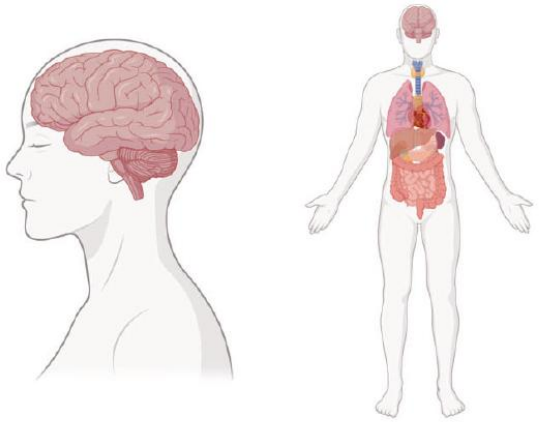
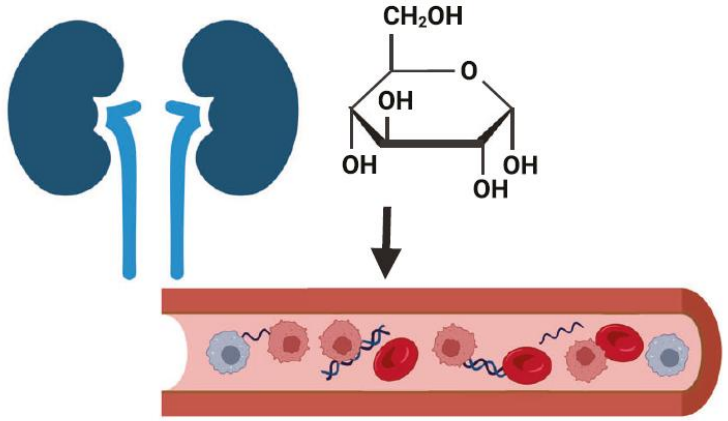
The relationship between SGLT2 and systemic blood pressure regulation

1 SGLT2 is found in various parts of the body and brain.



2 SGLT2 in the kidney reabsorbs glucose into the bloodstream.



3 SGLT2 inhibitors decrease blood sugar and blood pressure.

4 The role of SGLT2 in the brain may also influence blood pressure.

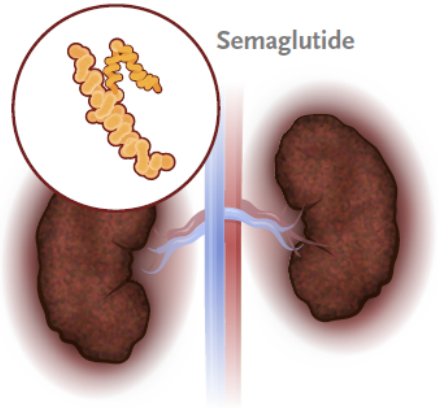
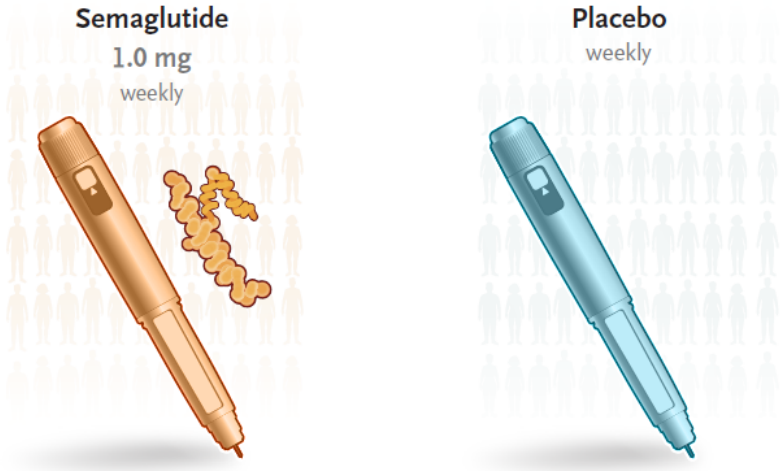
WHY WAS THE TRIAL DONE?

Semaglutide has been shown to improve glycemic control, lead to weight loss, and reduce cardiovascular events in patients with type 2 diabetes. Its effect on kidney outcomes in patients who also have chronic kidney disease is incompletely understood.



HOW WAS THE TRIAL CONDUCTED?

3533 participants with type 2 diabetes and chronic kidney disease were randomly assigned to receive weekly subcutaneous semaglutide (1.0 mg) or placebo. The primary outcome was major kidney disease events, a composite of the onset of kidney failure (initiation of dialysis, kidney transplantation, or an estimated glomerular filtration rate [eGFR] of <15 ml per minute per 1.73 m^2), at least a 50% reduction in eGFR from baseline, or death from kidney-related or cardiovascular causes.



PARTICIPANTS
