Modern approach of sarcopenia

Summary of risk factors and consequences of sarcopenia

Global prevalence

- Differing between definitions
- Around 10% to 16% in the elderly
- Higher among patient groups
- 18% in diabetes to 66% in unresectable esophageal cancer

Lifestyle factor

- Obesity, in particular visceral fat
- Physical inactivity
- Malnutrition
- Cigarette smoking
- Extreme sleep duration

Health status

- Diabetes and its complications
- Osteoporosis
- Heart disease
- Cognitive impairment
- Respiratory disease
- Depression and anorexia
- Parkinson's disease

Biomarkers

- Inflammatory markers
- Blood fatty acids and vitamin D
- Adiponectin
- Pulse wave velocity
- Gut microbiota

Sarcopenia

- Multi-omics study
- High-quality cohort study
- Mendelian randomization study
- Therapeutic development ٠

Consequence

Among patients

- ↑ Short- and long-term mortality
- ↑ Overall and severe complications
- ↑ Postoperative infection
- ↑ Prolonged hospitalization
- ↓ Survival rate

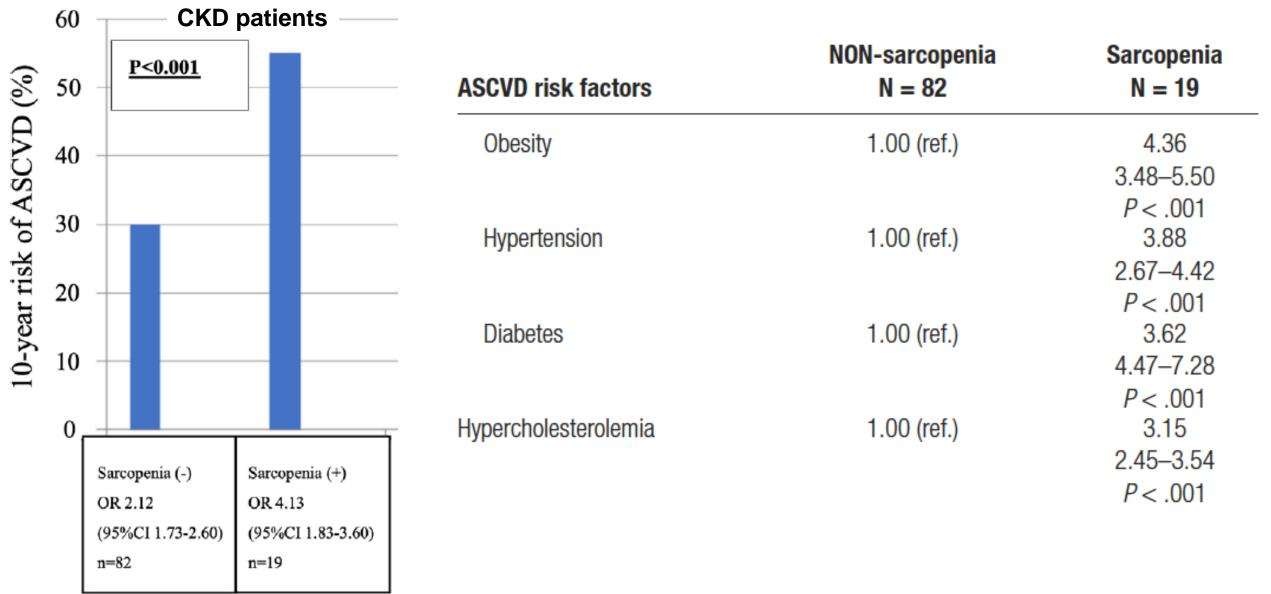

Among non-patients

- ↑ Mortality
- ↑ Cognitive impairment
- ↑ Osteoporosis, falls, and fracture
- ↑ Functional decline
- ↑ Hospitalization rate
- ↑ Metabolic syndrome and diabetes
- ↑ Nonalcoholic liver disease
- ↑ Liver fibrosis
- ↑ Hypertension
- ↑ Depression
- ↑ Dysphagia

Update of the sarcopenia diagnostic criteria

Global Leadership Initiative in Sarcopenia (GLIS)

- GLIS is an international initiative aiming to produce an inclusive definition of sarcopenia that can be widely accepted by all the current consensus groups that have proposed the definitions that are used currently.
- Launched by consensus groups from America, Asia, Europe and Oceania, GLIS intends to involve experts from all fields related to sarcopenia and to produce a definition that can be used widely both in clinical practice and in research.

SARCOPENIA GLOBAL DEFINITION Workflow

1. Informal meeting of members from former sarcopenia consensus group

(ANZSSFR, AWGS, EWGSOP, SDOC) 2019~2021

2. Constitution as initial steering committee: Sep. 2021

ANZSSFR – G Duque

AWGS – H Arai, LK Chen, J Woo

EWGSOP – AJ Cruz-Jentoft, F Landi, A Sayer, M Visser

SDOC – P Cawthon, R Fielding, S Bhasin

3. Involvement of organizations

Agreed to participate with different levels of involvement:

AAFS, AGS, ANZSFR, ESCEO, ESPEN, EuGMS, ICFSR, GSA, SCWD

Contacted: WHO. Not involved, but willing to promote an updated definition in future ICDs if suggested by a global group

European Geriatric Medicine (2022) 13:1239–1244 https://doi.org/10.1007/s41999-022-00706-5

SPECIAL ARTICLE

Defining terms commonly used in sarcopenia research: a glossary proposed by the Global Leadership in Sarcopenia (GLIS) Steering Committee

Mechanisms involved in sarcopenic obesity pathogenesis

Diagnostic procedure for the assessment of sarcopenic obesity (ESPEN and EASO)

diseases).

Obes Facts 2022;15:321-335

Working Group on Sarcopenic Obesity

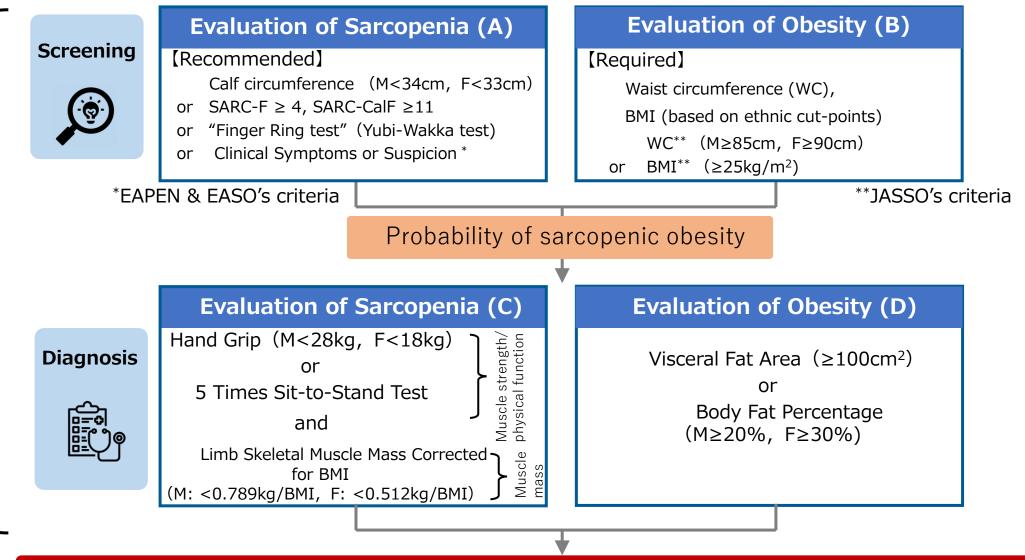

on Sarcopenia and Frailty

Japanese Association

(JASF)

Japan Society for the Study of Obesity (JASSO)

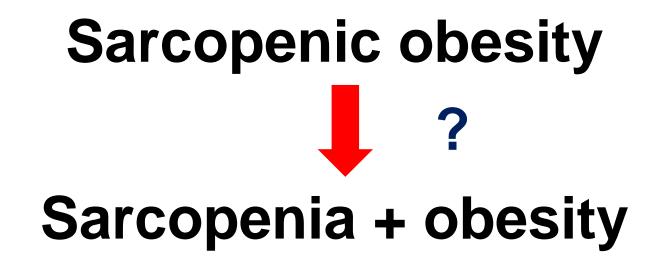

Chairman: Kojiro Ishii Members: Hidenori Arai, Kojiro Ueki, Hidetaka Wakabayashi, Minoru Yamada, Yutaka Kimura, Yoshifumi Tamura, Wataru Ogawa, Toru Kusakabe, Kiyoshi Sanada, Ryo Miyazaki, Yuya Watanabe, Yuki Someya

Stage I Sarcopenic Obesity : Low muscle strength/Low physical function + Low muscle mass + Obesity Stage II Sarcopenic Obesity :Low muscle strength/Low physical function + Low muscle mass + Obesity + Comorbidities (e.g. metabolic diseases, disabilities resulting from high FM and-or low muscle mass, cardiovascular and respiratory diseases)

Diagnostic Algorithm for Sarcopenic Obesity in Japan

By Joint Committee of the Japan Society for the Study of Obesity (JASSO) and the Japanese Association on Sarcopenia and Frailty (JASF)

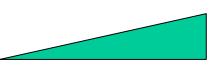

Osteosarcopenia ? Osteoporosis or osteopenia + sarcopenia

Sarcopenia vs. Sarcopenic obesity

Etiology: aging, physical inactivity, low nutritional intake, chronic inflammation

Insulin resistance

Intramuscular fat infiltration

Outcomes: disability, falls, fractures, mortality

CVD

Interventions: diet and exercise

Weight reduction

CVD prevention

Take home message

- Sarcopenia is one of the important geriatric diseases that need to be addressed for healthy longevity.
- Sarcopenia is commonly accompanied by cardiometabolic diseases and is associated with several clinical outcomes such as cardiovascular diseases, falls, fractures, disability, and mortality.
- The diagnostic algorithm has been established by the Asian Working Group for Sarcopenia (AWGS) in Asia, and GLIS has now developed the global consensus.
- Sarcopenic obesity is also associated with cardiovascular outcomes, and a consensus needs to be developed for the diagnosis.
